EAST DIVIDE IS

Samples of quartz from the East hitle brought in last evening attracted a good deal of attention. The ore which was taken from the face of the south drift on the 400 level carries iron sulphides indicabing that the drift is coming into histograde. The drift was run from the northeast crosscut that was extended under the big blowout on the surface that serves as a land mark for that section and the preswat work is on the footwall of what is believed to be the contact vein. On the Alto the north drift orebody has widened until now it is over three feet. The south drift is showing a change of formation.
